1. **Holes in inference patterns**

- **Terms and identity**

  (1a) 31 is prime.

  The number of persons in this room is 31.

  \[ \therefore \ \text{The number of persons in this room is prime.} \]

  \[ \varphi[n] [= P(n)] \]

  (b) It is fact of elementary arithmetic that 31 prime.

  The number of persons in this room is 31.

  \[ \therefore \ \text{It is fact of elementary arithmetic that the number of persons in this room is prime.} \]

  \[ \varphi[n] [= P(n)] \]

- **Problems with existential quantification**

  (2a) John’s salary is higher than Mary’s.

  John is the dean.

  Mary is the vice dean.

  \[ \therefore \ \text{The dean’s salary is higher than the vice dean’s.} \]

  \[ \varphi[d,v] \]

  (b) Bill knows that the dean’s salary is higher than the vice dean’s.

  John is the dean.

  Mary is the vice dean.

  \[ \therefore \ \text{Bill knows that John’s salary is higher than Mary’s.} \]

  \[ \varphi[j,m] [= s(j) > s(m)] \]

- **Problems with existential quantification**

  (3a) Urs is a Swiss millionaire.

  All millionaires admire Scrooge McDuck.

  \[ (\forall x) [M(x) \rightarrow A(x)] \]

  [Only millionaires admire Scrooge McDuck.]

  Urs is a Swiss admirer of Scrooge McDuck.

  \[ \varphi[A] [= S(u) & A(u)] \]

  Urs is an alleged millionaire.

  All millionaires admire Scrooge McDuck.

  Only millionaires admire Scrooge McDuck.

  Kim is an alleged admirer of Scrooge McDuck.

  \[ (\forall x) [A(x) \rightarrow M(x)] \]

  (4a) Paul is wearing a pink shirt with green sleeves.

  All pink shirts with green sleeves have striped collars and gold buttons.

  [Only pink shirts with green sleeves have striped collars and gold buttons.]

  Paul is wearing a shirt with striped collars and gold buttons.

  (b) Paul is looking for a pink shirt with green sleeves.

  All pink shirts with green sleeves have striped collars and gold buttons.

  Paul is looking for a shirt with striped collars and gold buttons.
(5a) Susan is entering a restaurant on Main Street.
   The only restaurants on Main Street are La Gourmande and Le Gourmet.
∴ Susan is entering La Gourmande, or [Susan is entering] Le Gourmet.

(b) Susan is looking for a restaurant on Main Street.
   The only restaurants on Main Street are La Gourmande and Le Gourmet.
∴ Susan is looking for La Gourmande, or [Susan is looking for] Le Gourmet.

(6a) Paul is wearing a pink shirt with green sleeves.
∴ There are pink shirts with green sleeves.

(b) Paul is looking for a pink shirt with green sleeves.
∴ There are pink shirts with green sleeves.

(7a) There have never been any pictures of Lily.
∴ It is not true that Pete showed Roger a picture of Lily.

(b) There have never been any pictures of Lily.
∴ It is not true that Pete owed Roger a picture of Lily.

2. Extensions

   • **Compositionality**

   **Substitution Principle**
   If two non-sentential expressions of the same category have the same meaning, either may replace the other in all positions within any sentence without thereby affecting the truth conditions of that sentence.

   **Principle of Compositionality**
   The meaning of a complex expression functionally depends on the meanings of its immediate parts and the way in which they are combined:

   (8)
   \[
   \begin{align*}
   Exp &= \left[ LP \right] \oplus \left[ RP \right] \\
   &= \left[ \begin{array}{c}
   LP \\
   \triangle
   \end{array} \right] \oplus \left[ \begin{array}{c}
   RP \\
   \triangle
   \end{array} \right]
   \end{align*}
   \]

   • **Meaning as communicative function**
   - *Extension*: [contribution to] reference
   - *Intension*: [contribution to] informational content
   - ...

   2
• Basic extensions

(9a) \([\text{Austin}] = \text{Austin}\) \([\text{proper name}] = \text{bearer}\)

(b) \([\text{the capital of Texas}] = \text{Austin}\) \([\text{definite description}] = \text{descriptee}\)

(c) \([\text{city}] = \{\text{London, Paris, Rome, Austin, Frankfurt,}\ldots\} = \{x \mid x \text{ is a city}\}\)

\([\text{count noun}] = \text{set of representatives}\)

(d) \([\text{snore}] = \{x \mid x \text{ snores}\}\) \([\text{intransitive verb}] = \text{set of satisfiers}\)

(e) \([\text{meet}] = \{(x,y) \mid x \text{ meets } y\}\) \([\text{transitive verb}] = \text{set of satisfier pairs}\)

(f) \([\text{show}] = \{(x,y,z) \mid x \text{ shows } y \text{ to } z\}\) \([\text{ditransitive verb}] = \text{set of satisfier triples}\)

(g) \([\text{shows } \text{Joe}] = \{(x,y) \mid x \text{ shows } y \text{ to Joe}\}\) \([\text{2-place predicate}] = \text{set of satisfier pairs}\)

(h) \([\text{shows } \text{Joe the Vatican}] = \{x \mid x \text{ shows the Vatican to Joe}\}\)

\([\text{1-place predicate}] = \text{set of satisfiers}\)

\[\parallel\] Parallelism between valency and type of extension

Frege (1891)

The extension of an \(n\)-place predicate is a set of \(n\)-tuples.

E.g. \([\text{Benny shows Angie the Vatican}] = \{(\) \mid Benny shows the Vatican to Angie\}\)

\(= \) the set of objects of the form ‘( )’ such that Benny shows the Vatican to Angie, i.e.:

\([\text{Benny shows Angie the Vatican}] = \{(\) , if Benny does show the Vatican to Angie

\(\emptyset\) otherwise

NB: \((\) = \(\emptyset\) = 0; hence \(\{(\)\) = \(\emptyset\) = \(\emptyset\) = 1!

\[\parallel\] Frege’s Generalization

Frege (1892)

The extension of a sentence \(S\) is its truth value, i.e. 1 if \(S\) is true and 0 if \(S\) is false.

• Constructing contributing extensions

(10a) From: \(\text{Exp} \models \text{Exp}\) \(\text{Exp} \models \\text{Exp}\)

\([\text{LP}] \text{ ? } [\text{RP}] \models [\text{Exp}] \models [\text{Exp}]

(b) \([\text{LP}] \) ( \([\text{RP}] \) = \([\text{Exp}]\)

(c) \([\text{LP}] = \{(\) \([\text{RP}] \), \([\text{Exp}]\) ) \mid \text{Exp} = \text{LP} + \text{RP}\)

(11a)

\([\text{Nobody sleeps}] \models \text{Nobody talks} \models \text{Nobody listens} \models \text{Nobody}\)

\([\text{nobody}] ? \text{sleeps} \models \text{nobody} ? \text{talks} \models \text{nobody} ? \text{listens} \models \text{nobody}\)

(b) \([\text{nobody}] \) ( \([\text{sleeps} ] \) = [nobody sleeps] \(\Rightarrow \) [nobody] \(S\) = 1 \(S\): sleepers

\([\text{nobody}] \) ( \([\text{talks} ] \) = [nobody talks] \(\Rightarrow \) [nobody] \(T\) = 0 \(T\): talkers

\([\text{nobody}] \) ( \([\text{listens} ] \) = [nobody listens] \(\Rightarrow \) [nobody] \(L\) = 1 \(L\): hearers

(c) \([\text{nobody}] = \{(S,1), (T,0), (L,1),\ldots\}\)

\(= \{(Y, \leftarrow \text{[person]} \cap Y = \emptyset \leftarrow i) \mid Y \text{ is a (possible) predicate extension}\)

\(= \lambda Y. \leftarrow \text{[person]} \cap Y = \emptyset \leftarrow \lambda Y. \leftarrow \text{[person]} \cap Y = \emptyset \leftarrow \)

NB: \(\leftarrow \ldots \leftarrow := \) the truth value that is 1 iff ...
(12a) \[\[\text{no boy}\]\] \checkmark \quad \[\[\text{no girl}\]\] \checkmark \quad \[\[\text{no chair}\]\] \checkmark

3. Intensions

- Logical Space as a model of content

(20a) 4 fair coins are tossed.
(b) At least one of the 4 tossed coins lands heads up.
(c) At least one of the 4 tossed coins lands heads down.
(d) Exactly 2 of the 4 tossed coins land heads up.
(e) Exactly 2 of the 4 tossed coins land heads down.

☞ Carnap’s Content

Carnap (1947)

The proposition expressed by a sentence is the set of possible cases of which that sentence is true.

(21a) 4 coins were tossed when John coughed.
(b) 4 coins were tossed and no one coughed.

☞ Wittgenstein’s Paradise

Wittgenstein (1921)

All (and only the) maximally specific cases (possible worlds) are members of a set W (aka Logical Space).

- From propositions to intensions

(22) \( p \subseteq W \Rightarrow \lambda w. w \in p \Rightarrow \) characteristic function (of \( p \) rel. to \( W \))

(23) The intension of an expression is its extension relative to Logical Space:

\[
[ E ] : W \to \{ x \mid x \text{ is of the “appropriate” type} \}
\]

- Intensional types

☞ Montagovian types

Montague (1970a)

- x is of type e \( \iff x \in U \);
- u is of type t \( \iff u \in (0,1) \);
- f is of type (a,b) \( \iff f: \{ x \mid x \text{ is of type } a \} \to \{ y \mid y \text{ is of type } b \} \)
- g is of type (s,c) \( \iff g: W \to \{ y \mid y \text{ is of type } c \} \)

☞ Two-sorted types

“Gallin (1975)”

- x is of type e \( \iff x \in U \);
- u is of type t \( \iff u \in (0,1) \);
- w is of type s \( \iff w \in W \);
- f is of type (a,b) \( \iff f: \{ x \mid x \text{ is of type } a \} \to \{ y \mid y \text{ is of type } b \} \)

- Notation

\[
[ [ E x p ] ]^c = [ [ E x p ] ](w)
\]
4. Attitude reports

- Substitution failure

(24) Fritz thinks that Hamburg is larger than Cologne.
    Hamburg is larger than Cologne.
    Pfäffingen is larger than Breitenholz.

\[
\therefore \text{Fritz thinks that Pfäffingen is larger than Breitenholz.}
\]

(25a)

\[
\begin{align*}
\left[ \text{thinks that Hamburg is larger than Cologne} \right]^{\text{true}} &= \left[ \text{thinks} \right]^{\text{true}} \oplus \left[ \text{Hamburg is larger than Cologne} \right]^{\text{true}} \\
\left[ \text{Hamburg is larger than Cologne} \right]^{\text{true}} &= 1
\end{align*}
\]

(25b)

\[
\begin{align*}
\left[ \text{thinks that Pfäffingen is larger than Breitenholz} \right]^{\text{true}} &= \left[ \text{thinks} \right]^{\text{true}} \oplus \left[ \text{Pfäffingen is larger than Breitenholz} \right]^{\text{true}} \\
\left[ \text{Pfäffingen is larger than Breitenholz} \right]^{\text{true}} &= 1
\end{align*}
\]

- Fregean approach

(26a)

\[
\begin{align*}
\left[ \text{thinks that Hamburg is larger than Cologne} \right]^{\text{true}} &= \left[ \text{thinks} \right]^{\text{true}} \oplus \left[ \text{Hamburg is larger than Cologne} \right]^{\text{true}} \\
\left[ \text{Hamburg is larger than Cologne} \right]^{\text{true}} &= \left[ \text{thinks} \right]^{\text{true}} \oplus \left[ \text{Pfäffingen is larger than Breitenholz} \right]^{\text{true}} \end{align*}
\]
(b) 

\[
\begin{align*}
\text{[[thinks that Pfäffingen is larger than Breitenholz]]}^{w^*} & \quad = \\
\text{[[thinks]]}^{w^*} \oplus \text{[[Pfählingen is larger than Breitenholz]]}^{w^*} & \quad = \\
\text{[[thinks]]}^{w^*} \oplus q & \quad = \\
\text{[[Pfählingen is larger than Breitenholz]]}^{w^*} & \quad = q
\end{align*}
\]

(27) \( \text{[[think]]}(w^*)(p) \neq \text{[[think]]}(w^*)(q) \)

(28) More expressions (of more types)

<table>
<thead>
<tr>
<th>Category</th>
<th>Example</th>
<th>Extension</th>

Fregean Compositionality

The extension of a complex expression functionally depends on the extensions or intensions of its immediate parts and the way in which they are combined:

\[
\left[\text{ExtExp} \begin{array}{c} \text{LP} \\ \text{RP} \end{array}\right]^{w^*} = \left[\text{LP}\right]^{w^*} \oplus \left[\text{RP}\right]^{w^*}
\]

or:

\[
\left[\text{IntExp} \begin{array}{c} \text{LP} \\ \text{RP} \end{array}\right]^{w^*} = \left[\text{LP}\right]^{w^*} \oplus \left[\text{RP}\right]^{w^*}
\]

... strengthens (by a uniformity condition):

Intensional compositionality

The intension of a complex expression functionally depends on the intensions of its immediate parts and the way in which they are combined:

\[
\left[\text{ArbExp} \begin{array}{c} \text{LP} \\ \text{RP} \end{array}\right] = \left[\text{LP}\right] \oplus \left[\text{RP}\right]
\]

... and gives rise to the:

Distinction between extensional and intensional constructions

A (binary) construction \( \text{Exp} \) (understood as the family of expressions of the Form \( \text{Exp}_i = \mathcal{F}(\text{LP}_i, \text{RP}_i) \), for some syntactic operation \( \mathcal{F} \)) is extensional iff there is a (binary) function \( \oplus \) such that, for any world \( w \) (and all \( i \)):

\[
\left[\text{Exp}_i\right]^{w^*} = \left[\text{LP}_i\right]^{w^*} \oplus \mathcal{F} \left[\text{RP}_i\right]^{w^*}
\]
Fregean Laziness

Substitution problems are solved by trading extensions for intensions.

(29a) Jones thinks that Hesperus is Phosphorus.

(b) Jones is an alleged murderer.

(c) Jones is attentively eating every apple.

(P1) \((\forall w) (\forall P) \left[ \left[ \text{attentively} \right]^w (P)(x) \leq P_w(x) \right]\) \(\leq \approx \) mat. impl.

(P2) \((\forall w) (\forall R) (\forall Q) (\forall x)\)

\[ \left[ \left[ \text{attentively} \right]^w (R \oplus Q)(x) = (Q_w y) \left[ \left[ \text{attentively} \right]^w (\lambda w'. \lambda x. R_w(x,y))(x) \right] \right] \]

\(\oplus\): combination of intensions of transitive verb and its quantificational object

(Zimmermann (1987; 1993a)

(P1) & (P2) \(\Rightarrow \left[ \text{attentively} \right] = \lambda w. \lambda P. P_w \)

(Fregean) laziness does not (always) pay.

(d) Jones seeks a unicorn.

Montague (1970a), only for verbs like raise
• **Modelling cognitive states in Logical Space**

Hintikka (1969)

Fritz in $w^*$ ...

\[ S = \text{Hamburg is larger than Cologne} \]

(30)

I: $W \setminus (\Diamond \cup [S])$; II: $[S] \setminus \Diamond$; III: $\Diamond \cap [S]$; IV: $\Diamond \setminus [S]$

\]
• More paraphrases

(51a) John is looking for a sweater.
(b) John wants to find a sweater.
(c) John is looking for an intentional sweater.

(52a) Mary owes me a horse.
(b) Mary is obliged to give me a horse.
(c) Mary owes me an arbitrary horse.

(53a) This horse resembles a unicorn.
(b) This horse could (almost) be a unicorn.
(c) This horse resembles a generic unicorn.

(53a) Jones hired an assistant.
(b) Jones saw to it that someone would become an/his assistant.
(c) Jones hired a would-be assistant.

• Quantificational analyses

(54)
(55a) \( e^+ = s(et) \)

(b) \([\text{sweater}^+](w^*) = \lambda P^{s(et)}. \vdash (\forall w)(\forall x^e) P \sqsubseteq [\text{sweater}] \rightarrow \)

(c) \([\text{look-for}](w^*) \)

\[ \lambda P^{s(et)}. \lambda x^e. \vdash (\forall w)[Bou(x)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& x \text{ finds } y] \rightarrow \]

Notation: \( P \sqsubseteq Q :\Rightarrow (\forall w)(\forall x^e) P(w)(x) \leq Q(w)(x) \)

- Monotonicity

(56a) **John is a looking for a red sweater.**

\[ \vdash \text{John is looking for a sweater.} \]

(b) **John is looking for a sweater.**

Mary is looking for a book.

\[ \vdash \text{John is looking for something Mary is looking for.} \]

Intersective construal (for simplicity): \([\text{red sweater}] = [\text{sweater}] \cap [\text{red}]\)

Notation: \( P \cap Q :\Rightarrow x^e. P(w)(x) = Q(w)(x) = 1 \)

(57) Relational analyses (with lexical decomposition)

(a) \((\forall w)\) Bou(John)(w^*)(w) \leq \vdash (\exists y^e) \text{ in } w, y \text{ is a sweater } \& y \text{ is red } \& \text{John finds } y \rightarrow \)

\[ \Rightarrow (\forall w) Bou(John)(w^*)(w) \leq \vdash (\exists y^e) \text{ in } w, y \text{ is a sweater } \& \text{John finds } y \rightarrow \]

(b) \((\forall w)\) Bou(John)(w^*)(w) \leq \vdash (\exists y^e) \text{ in } w, y \text{ is a sweater } \& \text{John finds } y \rightarrow \)

& \((\forall w)\) Bou(Mary)(w^*)(w) \leq \vdash (\exists y^e) \text{ in } w, y \text{ is a book } \& \text{Mary finds } y \rightarrow \]

- quantifier analysis – e.g. \( Q \equiv \lambda w. \lambda P. P = P; \)

\[ \Rightarrow (\exists Q^{s((et)l)}) [ [\text{look-for}](w^*)(Q)(Mary) \& [\text{look-for}](w^*)(Q)(John)] \]

- property analysis – e.g. \( Q = \lambda w. \lambda P. P = P; \)

\[ \Rightarrow (\exists Q^{s((et)l)}) [ [\text{look-for}](w^*)(P)(Mary) \& [\text{look-for}](w^*)(P)(John)] \]

(58) Quantificational analysis (with exact match)

(a) \((\exists P^{s(et)} \sqsubseteq [\text{sweater}] \cap [\text{red}]) (\forall w)[\text{Bou}(j)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& j \text{ finds } y] \)

\[ \Rightarrow (\exists P^{s(et)} \sqsubseteq [\text{sweater}])(\forall w)[\text{Bou}(j)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& j \text{ finds } y] \]

(b) \((\exists P^{s(et)} \sqsubseteq [\text{sweater}])(\forall w)[\text{Bou}(j)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& j \text{ finds } y] \)

& \((\exists P^{s(et)} \sqsubseteq [\text{book}])(\forall w)[\text{Bou}(m)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& m \text{ finds } y] \]

\[ \Rightarrow (\exists P^{s(et)})(\forall w)[\text{Bou}(m)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& m \text{ finds } y] \]

\[ \Rightarrow [\text{Bou}(j)(w^*)(w) \iff (\exists y^e) \text{ in } w, P(y) = 1 \& j \text{ finds } y] \]

\[ = (\exists P^{s(et)})(\forall w)[\text{look-for}](w^*)(P)(Mary) \& [\text{look-for}](w^*)(P)(John)] \]
Unspecificity $\Rightarrow$ Intensionality?

(59) **Arnim owns a bottle of 1981 Riesling-Sylvaner.**

* Riesling-Sylvaner is Müller-Thurgau.

**Arnim owns a bottle of 1981 Müller-Thurgau.**

(60) **Arnim owns the bottle that Franzis does not own.**

(a) $[\text{the } w^* (\text{bottle Franzis doesn't own}) (w^*)]$

$\lambda y. [\text{own } w^* (\lambda y^e. Y(y)(\text{Arnim})]

\leq \vdash (\exists y^e) [ [\text{bottle } w^* (y) = [\text{own } w^* (\lambda y^e. Y(y)(\text{Arnim}) = 1) \vdash$

(b) $[\text{own } w^* ( [\text{the } w^* (\text{bottle Franzis doesn't own}) (w^*)](w^*)](\text{Arnim})

\leq [\text{own } w^* ( [\text{the } w^* (\text{unicorn}) (w^*)](w^*)](\text{Arnim})$

(b) **Matt was looking for some change before the conference.**

(63a) **Matt needs most of the small bills that were in the cash-box.**

(b) **Matt is looking for most of the small bills that were in the cash-box.**
(64) Zimmermann (2001: 526)

**Existential Impact**
From \( x \text{ Rs an N} \) infer: There is at least one \( N \).

**Extensionality**
From \( x \text{ Rs an N, Every N is an M, and Every M is an N infer: } x \text{ Rs an M.} \)

**Specificity**
From \( x \text{ Rs an N infer: Some (specific) individual is Red by x.} \)

5. **General topics**

- **Propositionalism**
  Forbes (2000; 2006); M. Montague (2007)

  (P) All (linguistic, mental, perceptual, pictorial,…) content is propositional.

  (Q) All intensional contexts are parts of embedded clauses.
  Quine (1956)

(65a) \[ \text{[Hesperus is a planet]} \neq \text{[Phosphorus is a planet]} \]
\[ \Rightarrow \text{[Hesperus] } \neq \text{[Phosphorus]} \]
Frege (1892)

(b) The thirsty man wants beer.
Meinong (1904): intentional object

(c) Jones worships a Greek goddess.
R. Montague (1969) [crediting H. Kamp]

(d) Lex Luthor fears Superman (but not Clark Kent).
Forbes (2000)

(e) Horatio believes that things Horatio doesn’t believe in exist.
Szabó (2003): coherent belief

  (e) John likes chocolate.
  John wants to have chocolate.

  (f) Meinong (1904): intentional object

- **Russellian analysis**
  Russell (1905); Whitehead & Russell (1910); Cresswell (1973)

(66) **Denotations and their types**
